## **Question-1-1.5-2**

## EE24BTECH11035 - KOTHAPALLI AKHIL

## **Question:**

Find the ratio in which the Y axis divides divides the line segment joining points (6, -4) and (-2, -7). Also find the point of intersection.

## **Solution:**

| Point | Coordinates |
|-------|-------------|
| A     | (6, -4)     |
| В     | (-2, -7)    |

TABLE 0: variables used

Let the point on the Y-axis be  $\begin{pmatrix} 0 \\ y \end{pmatrix}$ ,

The given two points are  $\begin{pmatrix} 6 \\ -4 \end{pmatrix}$  and  $\begin{pmatrix} -2 \\ -7 \end{pmatrix}$ .

The above 3 points are collinear.

Construct a Matrix for the above points

$$M = \begin{pmatrix} 0 & y & 1 \\ 6 & -4 & 1 \\ -2 & -7 & 1 \end{pmatrix} \tag{0.1}$$

The Determinant of the matrix is 0

$$Det = 0(-4+7) - y(6+2) + 1(-42-8) = 0 (0.2)$$

$$\implies y = -6.25 \tag{0.3}$$

 $\therefore$  The point on Y-Axis is  $\begin{pmatrix} 0 \\ -6.25 \end{pmatrix}$ 

Assume point  $\bf B$  divides the line segment  $\bf AC$  in the ratio k:1. According to the section formula:

$$\mathbf{B} = \frac{k\mathbf{C} + \mathbf{A}}{k+1} \tag{0.4}$$

Substituting the values:

$$\binom{0}{-6.25} = \frac{k \binom{-2}{-7} + \binom{6}{-4}}{k+1} \tag{0.5}$$

This gives us two equations:

$$0 = \frac{-2k+6}{k+1}, \quad -6.25 = \frac{-7k-4}{k+1} \tag{0.6}$$

Solving for k from the first equation:

$$0 = -2k + 6 \Rightarrow 2k = 6 \Rightarrow k = 3 \tag{0.7}$$

Therefore, the ratio in which  ${\bf B}$  divides  ${\bf AC}$  is 3:1 .
